PROFESSIONAL SUMMARY

Entry-level Data Analyst / Data Engineer with a B.E. in Information Science & Engineering and hands-on experience in Python, SQL, Power BI, and machine learning. Built end-to-end dashboards, product analyses, and LSTM/DBSCAN models for forecasting and anomaly detection. Familiar with Snowflake, dbt, and AWS for building ETL pipelines and analytics-ready datasets.

EDUCATION

B.E. in Information Science & Engineering | Graduated: 2025 | CGPA: 8/10

P.E.S. College of Engineering, Mandya

Relevant Coursework: Python Programming, IoT & Cloud Computing, Cyber Security Fundamentals

TECHNICAL SKILLS

Programming Languages: Python, SQL, C

Databases / SQL: MySQL, Snowflake, Data Modeling, ETL Pipelines

Cloud / Big Data: AWS, dbt, Machine Learning (LSTM, DBSCAN), Anomaly Detection, Time-Series Forecasting

Visualization / Tools: Power BI, MS Excel, Git, GitHub, MS Office, AI-Assisted Development

PROJECTS

End-to-End Dashboard | Data Visualization | [Link](#)

- Developed an end-to-end analytics dashboard in Power BI that turns raw data into interactive visual reports for decision-making.
- Prepared and modeled source data with SQL and Excel to create clean, reliable datasets for reporting.
- Designed KPIs, charts, and filters that let users explore trends without writing queries.
- Published the full project on GitHub with version control to keep the workflow reproducible.

Tech Stack – Power BI, SQL, Excel, Git, GitHub

AC Company Product Analysis | Data Analysis | [Link](#)

- Analyzed AC company product data to compare product performance across key categories.
- Queried and aggregated the data using SQL and Excel to surface top and bottom performers and underlying patterns.
- Visualized findings in Power BI to communicate insights clearly to non-technical stakeholders.
- Summarized the results into actionable recommendations for product decisions.

Tech Stack – Power BI, SQL, Excel

Final-Year Project: ML-Based Water Consumption Analytics | Machine Learning | [Link](#) | [Paper](#)

- Built the machine learning layer of an IoT water monitoring system, using tank-level sensor readings as time-series input for analysis.
- Developed an LSTM model in Python to forecast water consumption and generate predictive insights for optimizing usage.
- Applied DBSCAN clustering to group consumption patterns and flag anomalous usage that deviates from normal behavior.
- Integrated model outputs with threshold-based alerts and notifications to help prevent overflow and dry-run conditions.
- Earned a finalist place for Best Final Year College Project 2025 and published the work as a research paper.

Tech Stack – Python, LSTM, DBSCAN, Time-Series Analysis, Anomaly Detection

Doset (Vibe Coding Project) | AI-Assisted Development | [Link](#)

- Built a working application end to end using AI-assisted “vibe coding,” turning requirements into structured prompts and functional code.
- Iterated on prompts and reviewed generated code to debug issues and refine features until behavior matched the intended workflow.
- Managed the project with Git and GitHub, keeping the source code version-controlled and shareable.

Tech Stack – AI-Assisted Development, Prompt Engineering, Git, GitHub

CERTIFICATIONS & AWARDS

- **NPTEL Certifications 2025 – Python Programming, IoT & Cloud Computing:** coursework in programming, embedded systems, communication protocols, and cloud architecture. [Link](#)
- **Cyber Security Fundamentals – Zscaler:** practical knowledge of networking concepts, security principles, threat detection, and secure system design. [Link](#)
- **Best Final Year College Project 2025 – Finalist:** IoT-Based Automatic Water Monitoring System with real-time monitoring and analytics.
